

I think the Issue of BPL is full of holes. I think the FCC needs to further define How the providers are to handle interference complaints, and add specific language to the rules detailing this. In reality it would seem that the rural customer will be the very last to be privy to this system, due to start up costs. Tests in other countries have shown that this system generates extreme interference to licensed communications systems and has in fact been banned in several countries. I also think this ruling should wait until several organizations have time to test the impact on licensed systems.
